I believe all families need access to safe and nutritious food and that farmers and farm families need access to technologies that allow them to produce more while reducing resource use and improving economic return. Improved access to nutrition and income improves the health and healthcare of mothers and children, benefits farming communities, promotes child development, enhances access to education, and produces benefits for generations to come.

As a Pediatrician and Toxicologist at an Agricultural Company I am responsible for evaluating product safety for consumer and farm use. The digital age has made it increasingly easy to access information. While I value access to knowledge, misinformation is also available and many individuals lack scientific technical background to evaluate and understand the information at hand. A clear understanding of agriculture, safety, and nutrition is essential if we are to manage agricultural policy and practice to feed a growing population using limited land and other resources.

At Monsanto, we are working hard to do a better job talking about the great science we do and its positive impacts on food and agriculture. I work with a team of talented, responsible and motivated scientists to communicate our science effectively.

Board Certified: American Board of Pediatrics, Royal College of Physicians of Canada (Pediatrics); American Board of Clinical Pharmacology, American Board of Medical Toxicology and Conjoint Subspecialty Boards- Toxicology.

Specialties: Clinical, Occupational, Industrial, Environmental and Forensic Toxicology.
